

**GENERAL DESCRIPTION**

The EV1542DK-TFT-00A is the evaluation board for TFT applications using the MP1542. The MP1542 can be operated at 700KHz or 1.3MHz allowing for easy filtering and low noise. An external compensation pin gives the user flexibility in setting loop dynamics, which allows the use of small, low-ESR ceramic output capacitors. Soft-start results in small inrush current and can be programmed with an external capacitor. The MP1542 operates from an input voltage as low as 2.5V and can generate 12V at up to 500mA from a 5V supply.

The EV1542DK-TFT-00A provides  $V_{OUT1}$  from the boost output and also derives  $V_{OUT3}$  (positive) and  $V_{OUT2}$  (negative) from the charge pumps off of the boost switching node.

**ELECTRICAL SPECIFICATIONS**

Parameter	Symbol	Value	Units
Input Voltage	$V_{IN}$	3 – 3.6	V
Output Voltage 1	$V_{OUT1}$	9	V
Output Current 1	$I_{OUT1}$	150	mA
Output Voltage 2	$V_{OUT2}$	-8	V
Output Current 2	$I_{OUT2}$	10	mA
Output Voltage 3	$V_{OUT3}$	26	V
Output Current 3	$I_{OUT3}$	5	mA

**FEATURES**

- 3 Outputs in a Single Package: Boost Converter for 9V, Positive Charge Pump for 26V and Negative Charge Pump for -8V
- 3V to 3.6V Operating Input Range
- Uses Tiny Capacitors and Inductors
- 700KHz/1.3MHz Fixed Switching Frequency
- Externally Compensated
- Programmable Soft-Start
- UVLO, Thermal Shutdown
- Internal Current Limit

**APPLICATIONS**

- Handheld Computers and PDAs
- Digital Still and Video Cameras
- Small LCD Displays

## QUICK START GUIDE

The output voltage of this board is set to 9V, -8V and 26V on VOUT1, VOUT2 and VOUT3, respectively. The board layout accommodates most commonly used inductors and output capacitors.

1. Preset the power supply to  $3V \leq V_{IN} \leq 3.6V$ .
2. Turn off the power supply.
3. Connect the power supply terminals to:
  - a. Positive (+): VIN, EN
  - b. Negative (-): GND
4. Connect the load to:
  - a. Positive (+): VOUT1, VOUT3, GND (for the negative output)
  - b. Negative (-): GND, VOUT2 (for the negative output)
5. Turn on the power supply after making the connections.
6. The MP1542 is disabled on the evaluation board if only VIN is applied. To enable the MP1542, EN needs to be pulled HIGH.
7. The output voltage  $V_{OUT1}$  can be changed by varying R1. Calculate the new value using the formula:
$$R1 = \left( \frac{V_{OUT1}}{V_{FB}} - 1 \right) R2$$

Where  $V_{FB} = 1.25V$  and  $R2 = 10k\Omega$

For example, for  $V_{OUT1} = 7.5V$   
$$R1 = \left( \frac{7.5V}{1.25V} - 1 \right) \times 10k\Omega = 50k\Omega$$

Therefore use a 49.9k $\Omega$  standard 1% value resistor.
