

### DESCRIPTION

The EV4601EF-00A Evaluation Board is designed to demonstrate the capabilities of MPS' MP4601EF for TV backlighting applications. MP4601 is an integrated Buck-Boost white LED driver which is suitable for TV and big panel backlighting applications with MPS patented pending technology.

With a 12V input  $V_{IN}$  and a high voltage source  $V_{INH}$ , EV4601EF-00A can deliver a regulated voltage ( $V_{INH}$  to  $V_{INH}+60V$ ) to drive a LED string over 350V. The LED current is regulated to about 120mA. The EV4601EF-00A can be synchronized. Several EV4601EF-00As can be used together to drive a TV panel

### ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	$V_{IN}$	12±10%	V
Enable	EN	5±10%	V
Dimming	DIM	5±10%	V
LED Current	$I_{LED}$	120±5%	mA
Switching Frequency	fs	300	kHz
Over Voltage Protection	$V_{LED-Max}$	-63	V

### FEATURES

- Novel Power Leverage Control Technology
- Negative Output Buck-Boost Operation
- Switching Frequency Synchronization
- Analog and PWM Dimming Control
- Programmable Cycle-by-Cycle Over Current Protection
- Thermal Shutdown Protection
- LED Short and Open Protection
- Fault Output for Short LED Protection
- Output Short Circuit Protection

### APPLICATIONS

- TV Backlighting
- Large LCD Panels Backlighting

"MPS" and "The Future of Analog IC Technology", are Registered Trademarks of Monolithic Power Systems, Inc.

### EV4601EF-00A EVALUATION BOARD

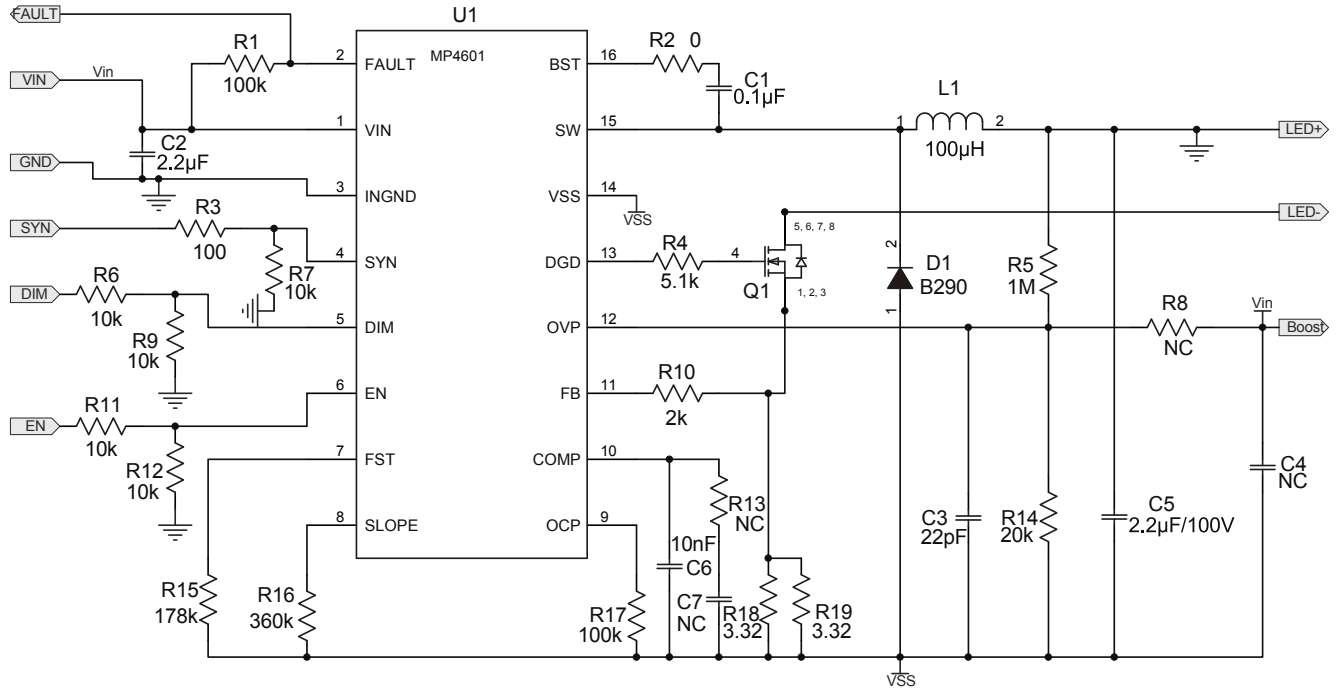

(L x W x H) 5cm x 5cm x 4.5mm

Board Number	MPS IC Number
EV4601EF-00A	MP4601EF

Efficiency vs.  $V_{INH}$

## EVB TEST RESULTS

Performance waveforms are tested on the evaluation board.

VIN = 12V, VINH=150V, VLED=180V, ILED = 120mA, TA = 20°C, unless otherwise noted.

## QUICK START GUIDE

1. Check the LED string voltage and preset the high voltage power supply's output. For example, 60 LED string needs 180V. Set the high voltage power supply output  $V_{INH}$  as 150V.
2. Set a second power supply VIN to 12V as the input of all the EVBs. Set a third power supply to 5V as the EN input to all the EVBs, Set a fourth power supply to 5V as the DIM input of all EVBs.
3. Turn-off all power supplies.
4. Connect the positive terminal of the high voltage power supply to all the anodes of the LED strings, and the negative terminal to all the EVB GND connector.
5. Connect each LED string cathode to the LED- connector on one EVB individually (one EVB for one LED string).
6. Connect VIN (12V) the positive terminal to all the EVB VIN connectors and the negative terminal to all the EVB GND connectors.
7. Connect the 5V DIM power supply positive terminal to all the EVB DIM connectors, and negative terminal to all the EVB GND connectors.
8. Connect the 5V EN power supply positive terminal to all the EVB EN connectors, and negative terminal to all the EVB GND connectors.
9. Connect all SYNC pin of all EVBs together for synchronization if necessary.
10. Turn on the high voltage power supply.
11. Turn on the 12V power supply.
12. Turn on the 5V DIM power supply.
13. Turn on the 5V EN power supply. All the LED strings should be lighted.
14. To demo the dimming function: replace the 5V power supply with a function generator. Set the PWM signal amplitude to 5V and the frequency within 100Hz to 20kHz range. For analog dimming, adjust the power supply on DIM connector from 1.4V to 3V
