EV9447-L-00A

High-Efficiency, Fast-Transient, 5A, 36V Step-Down Converter Evaluation Board

DESCRIPTION

The EV9447-L-00A is an evaluation board for the MP9447, a high-efficiency step-down regulator with integrated power MOSFETs.

MP9447 offers a very compact solution to achieve a 5A, continuous-output current over a wide input-supply range with excellent load and line regulation. It also provides fast transient response and good stability for wide input-supply and load range.

The EV9447-L-00A is a fully assembled and tested evaluation board. It generates a +5V output voltage at load current up to 5A from a 7V to 36V input range. Switching frequency is set at 500kHz.

QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output to between 7V and 36V, and then turn it off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The MP9447GL will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.25V to turn on the regulator, drive EN less than 0.86V to turn it off.
6. An input under voltage lockout (UVLO) function is implemented by the addition of a resistor divider R5 and R8. The EN threshold is 0.86V (falling edge), so V_{IN} UVLO threshold is. $0.86\times(1+\frac{R5}{R8})$
7. Use R1 and R2 to set the output voltage with V_{FB} = 0.815V. For R2 = 10kΩ, R1 can be determined by: $R1=12.27\times(V_{OUT}-0.815)$ (kΩ). Follow the Application Information section in the device datasheet to recalculate the compensation, inductor and output capacitor values when output voltage is changed.
