

DESCRIPTION

The EVQ4560-N-00A is an evaluation board for the MPQ4560, a high frequency step-down regulator with an integrated power MOSFET.

The MP4560 integrates a 250mΩ MOSFET that provides 2A load current over a wide operating input voltage of 4.5V to 55V.

Current mode control provides fast transient response and eases loop stabilization. An internal soft-start prevents inrush current at turn-on.

The EVQ4560-N-00A is a fully assembled and tested PCB. It generates a +5V output voltage at load current up to 2A from an 8V to 55V input range. Switching frequency is set at 700kHz.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	8 – 55	V
Output Voltage	V_{OUT}	5	V
Output Current	I_{OUT}	2	A

FEATURES

- 2A Output Current
- Programmable Switching Frequency up to 2MHz
- Wide 8V to 55V Operating Input Range
- Adjustable Output from 0.8V
- Fully Assembled and Tested

APPLICATIONS

- High Voltage Power Conversion
- Game Machines
- Automotive Systems
- Industrial Power Systems
- Distributed Power Systems
- Printer Systems
- Battery Powered Systems

QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output to between 8 and 55V, and then turn it off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The MPQ4560DN will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.55V to turn on the regulator, drive EN less than 1.23V to turn it off.
6. An input under voltage lockout (UVLO) function is implemented by the addition of a resistor divider R1 and R2. The EN threshold is 1.23V (falling edge), so V_{IN} UVLO threshold is $1.23V \times \left(1 + \frac{R1}{R2}\right)$. It is preset to around 3.8V on this board.
7. Use R6 and R8 to set the output voltage with $V_{FB} = 0.8V$. For $R6 = 23.7k\Omega$, R8 can be determined by: $R8 = 29.625 \times (V_{OUT} - 0.8)$ (k Ω). Follow the Application Information section in the device datasheet to recalculate the compensation, inductor and output capacitor values when output voltage is changed.
