

DESCRIPTION

The MP62170-3/MP62171-3 Power Distribution Switch features internal current limiting to prevent damage to host devices due to faulty load conditions. The MP62170-3/MP62171-3 analog switch has 75mΩ on-resistance and operates from 2.7V to 5.5V input. It is available with guaranteed current limits, making it ideal for load switching applications. The MP62170-3/MP62171-3 has built-in protection for both over current and increased thermal stress. For over current, the device will limit the current by changing to a constant current mode.

As the temperature increases as a result of short circuit, then the device will shut off. The device will recover once the device temperature reduces to approx 120°C.

MP62170-3/MP62171-3 is available in 8-pin MSOP and SOIC package without exposed pad.

FEATURES

- 1.5A Continuous Current
- Accurate Current Limit
- 2.7V to 5.5V Supply Range
- 90uA Quiescent Current
- 75mΩ MOSFET
- Thermal-Shutdown Protection
- Under-Voltage Lockout
- 8ms FLAG Deglitch Time
- No FLAG Glitch During Power Up
- Reverse Current Blocking
- Active High & Active Low Options

APPLICATIONS

- Smartphone and PDA
- Portable GPS Device
- Notebook PC
- Set-top-box
- Telecom and Network Systems
- PC Card Hot Swap
- USB Power Distribution

"MPS" and "The Future of Analog IC Technology" are Trademarks of Monolithic Power Systems, Inc.

TYPICAL APPLICATION

* EN is active high for MP62171-3
SINGLE-CHANNEL

ORDERING INFORMATION

Part Number	Enable	Switch	Maximum Continuous Load Current	Typical Short-Circuit Current @ T _A =25C	Package	Top Marking	Free Air Temperature (T _A)
MP62170ES-3 *	Active Low	Single	1.5A	2.3A	SOIC8	62170ES	-20°C to +85°C
MP62170EK-3					MSOP8	62170EK	
MP62171ES-3	Active High				SOIC8	62171ES	
MP62171EK-3					MSOP8	62171EK	

* For Tape & Reel, add suffix -Z (e.g. MP62170ES-3-Z).

For RoHS compliant packaging, add suffix -LF (e.g. MP62170ES-3-LF-Z)

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

IN	-0.3V to +6.0V
EN, FLAG, OUT to GND	-0.3V to +6.0V
Continuous Power Dissipation (T _A = +25°C) ⁽²⁾	
SOIC8.....	1.4W
MSOP8.....	0.83W
Junction Temperature	150°C
Lead Temperature	260°C
Storage Temperature.....	-65°C to +150°C
Operating Junct. Temp (T _J).....	-20°C to +125°C

Thermal Resistance ⁽³⁾ θ_{JA} θ_{JC}

SOIC8.....	90	42...	°C/W
MSOP8....	150	65...	°C/W

Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance θ_{JA}, and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX) - T_A) / θ_{JA}. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- Measured on JESD51-7, 4-layer PCB.

ELECTRICAL CHARACTERISTICS (4) **$V_{IN}=5V$, $T_A=+25^{\circ}C$, unless otherwise noted.**

Parameter	Condition	Min	Typ	Max	Units
IN Voltage Range		2.7		5.5	V
Supply Current	EN Enabled, $I_{OUT}=0$	70	90	120	μA

DETAILED DESCRIPTION

Over Current

When the load exceeds trip current (minimum threshold current triggering constant-current mode) or a short is present, MP62170-3/MP62171-3 switches into to a constant-current mode (current limit value). MP62170-3/MP62171-3 will be shutdown only if the over current condition stays long enough to trigger thermal protection.

Trigger over current protection for different overload conditions occurring in applications:

- 1) The output has been shorted or overloaded before the device is enabled or input applied. MP62170-3/MP62171-3 detects the short or overload and immediately switches into a constant-current mode.
- 2) A short or an overload occurs after the device is enabled. After the current-limit circuit has been tripped (reached the trip current threshold), the device switches into constant-current mode. However, high current may flow for a short period of time before the current-limit circuit can react.
- 3) Output current has been gradually increased beyond the recommended operating current. The load current rises until the trip current threshold is reached or until the thermal limit of the device is exceeded. The MP62170-3/MP62171-3 is capable of delivering current up to the trip current threshold without damaging the device. Once the trip threshold has been reached, the device switches into its constant-current mode.

Flag Response

The FLAG pin is an open drain configuration. When over current or over temperature is encountered, FLAG will report a fail mode (low level). It remains low until fault condition is removed.

For over temperature, The FLAG is not deglitched. When output is shorted to ground and the device enters to thermal cycle, FLAG will keep low level until the device resumes normal operation.

For over current, 8ms deglitch timeout is needed. This is used to ensure that no false fault signals are reported. This internal deglitch circuit eliminates the need for components.

Thermal Protection

The purpose of thermal protection is to prevent damage in the IC by allowing excessive current to flow and heating the junction. The die temperature is internally monitored until the thermal limit is reached. Once this temperature is reached, the switch will turn off and allow the chip to cool. The switch has a built-in hysteresis.

Under-voltage Lockout (UVLO)

This circuit is used to monitor the input voltage to ensure that the MP62170-3/MP62171-3 is operating correctly. This UVLO circuit also ensures that there is no operation until the input voltage reaches the minimum spec.

Enable

The logic pin disables the chip to reduce the supply current. The device will operate once the enable signal reaches the appropriate level. The input is compatible with both COMS and TTL.

APPLICATION INFORMATION

Power-Supply Considerations

Over 10 μ F capacitor between IN and GND is recommended. This precaution reduces power-supply transients that may cause ringing on the input and improves the immunity of the device to short-circuit transients.

In order to achieve smaller output load transient, placing a high-value electrolytic capacitor on the output pin(s) is recommended when the output load is heavy.

DETAIL "A"

NOTE:

- 1) CONTROL DIMENSION IS IN INCHES. DIMENSION IN BRACKET IS IN MILLIMETERS.
- 2) PACKAGE LENGTH DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS.
- 3) PACKAGE WIDTH DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSIONS.
- 4) LEAD COPLANARITY (BOTTOM OF LEADS AFTER FORMING) SHALL BE 0.004" INCHES MAX.
- 5) DRAWING CONFORMS TO JEDEC MS-012, VARIATION AA.
- 6) DRAWING IS NOT TO SCALE.
